

Take control of enterprise database licensing before the next audit.

Licencify helps organisations reduce database license risk, prepare faster for audits, and gain continuous visibility into Oracle and enterprise database environments.

THE PROBLEM

Database licensing is one of the most difficult areas of software asset management. Oracle, Microsoft, IBM and SAP database environments often run across physical servers, virtualised clusters, cloud platforms and legacy systems.

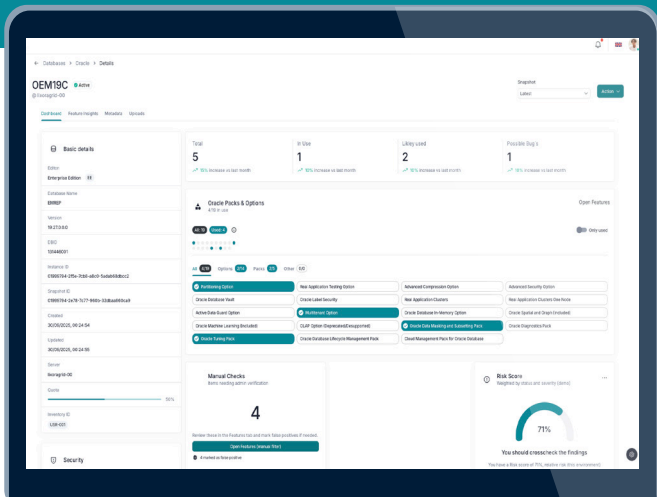

For many organisations, the current process is still too manual:

- ▶ Database inventories are incomplete or outdated.
- ▶ Infrastructure and database data are not connected.
- ▶ Audit evidence is collected under time pressure.
- ▶ License risks are discovered too late.
- ▶ Existing SAM tools may not provide enough database-specific transparency.

WHY LICENCIFY

The platform collects data from databases, infrastructure platforms, APIs, exports, file uploads or a local Licencify Gateway. It then calculates license-relevant usage, highlights potential compliance risks, identifies optimization opportunities and generates audit-ready reports.

- ▶ **Database-specific visibility**
- ▶ **Explainable license calculations**
- ▶ **Faster audit preparation**
- ▶ **Clear risk indicators**
- ▶ **Better collaboration** — between DBAs, infrastructure, SAM and procurement
- ▶ **Focused software** — without a full SAM transformation project
- ▶ **Agentless** — collecting Data without an single Agent

HOW IT WORKS

COLLECT

DB and infrastructure
Agentless

ANALYZE

Calculate license, identify
risk

REPORT

audit and management-
ready reports.
