

**Licencify is building the database license intelligence platform for modern enterprises.**

Licencify helps organisations gain continuous visibility into enterprise database license usage, reduce audit risk, and identify cost-saving potential across complex on-premise, virtualised, and cloud environments.

## THE PROBLEM

Enterprise database licensing is complex, expensive, and difficult to control. Organisations often operate hundreds of databases across Oracle, Microsoft, IBM, SAP and cloud platforms, but license-relevant data is scattered across DB systems, infrastructure tools, spreadsheets, contracts and vendor-specific reports. Traditional SAM platforms are built to cover broad software asset

**Your audit preparation is slow, compliance risks are discovered too late, and license decisions are often made without full technical transparency.**

## WHY LICENCIFY

Licencify is built to focus deeply on the database layer, where licensing complexity, technical dependencies and audit exposure are especially high.

- **DATABASE-FIRST** — starting with Oracle and expanding across Microsoft, IBM, SAP and other enterprise database technologies.
- **EXPLAINABLE** — every calculation is traceable to technical evidence.
- **FAST TO ADOPT** — focused platform instead of large SAM transformation projects.
- **SECURE BY DESIGN** — local gateway architecture with optimal data pseudonymization.
- **PARTNER-READY** — suitable for end customer, reseller and managed service offerings.

## THE VISION

Licencify will become the trusted license intelligence layer for enterprise database and infrastructure environments — helping organisations understand license risk continuously instead of reacting only during audits.
